BUS BOOKING MANAGEMENT SYSTEM

INTRODUCTION

The **Bus Booking Management System** is a database-driven project developed using **Python** and **MySQL**. This system is designed to automate and simplify the process of managing bus routes, user accounts, and seat bookings. It provides separate access for users and administrators, allowing customers to register, log in, book seats, and view booking details, while administrators can manage buses, routes, and users. By integrating Python with a relational database, the project demonstrates how programming and database management can be effectively combined to solve real-world problems. The system reduces manual effort, improves data accuracy, and ensures efficient handling of booking operations.

OBJECTIVES OF THE PROJECT

The main objective of the Bus Booking Management System is to apply database and programming concepts to a real-world application. This project helps students understand how software systems are used to manage, store, and retrieve data efficiently.

- To design and implement a database-driven system for managing bus routes, users, and bookings.
- To apply programming and database concepts in solving real-world problems.
- To understand the use of structured queries for inserting, updating, deleting, and retrieving data.
- To develop logical and effective program modules for user and admin operations.
- Students will demonstrate ability to conduct a research or applied Computer Science project, requiring writing and presentation skills which exemplify scholarly style in computer science.
